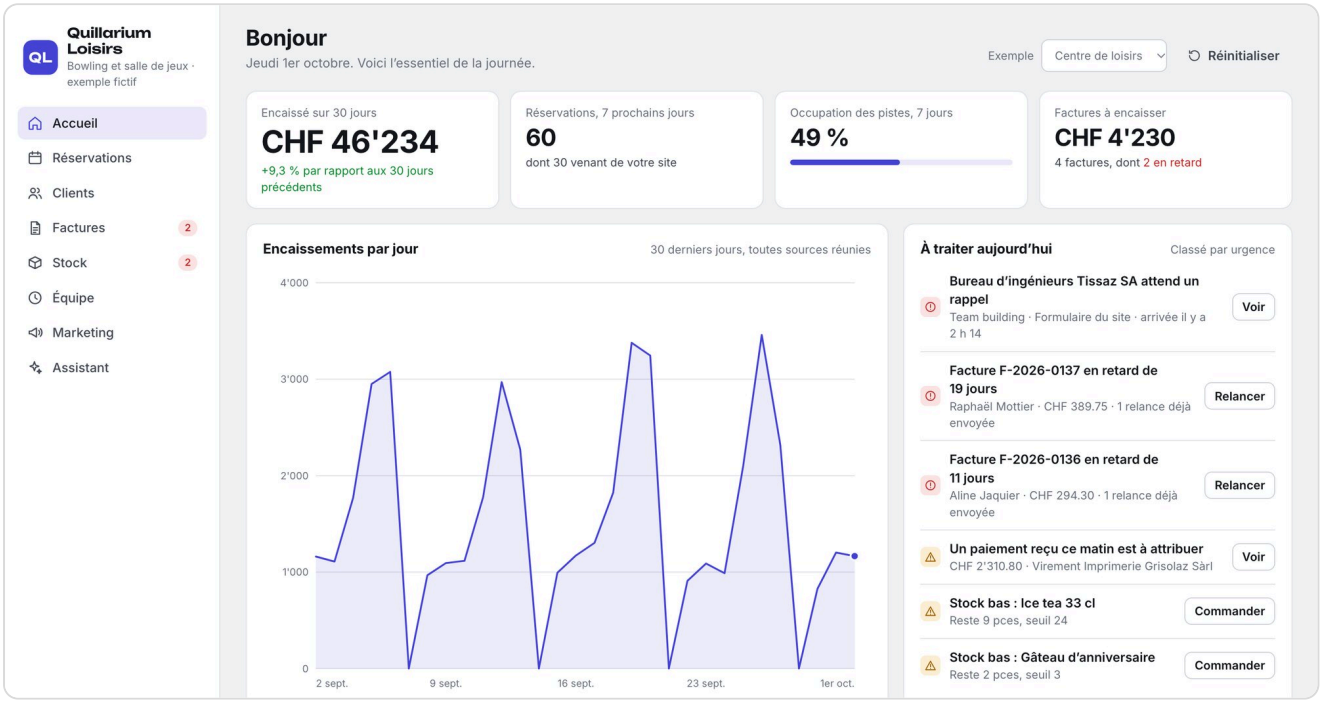
CASE STUDY

A leisure operator runs all its sites from a single tool.

An indoor leisure business with several sites in French-speaking Switzerland welcomes groups, birthday parties and companies every week. We built the system that connects online booking, the till, the bank, the team and advertising.



Demo screen (in French), with a fictional company and invented data, based on the dashboard built for this client.

The starting point

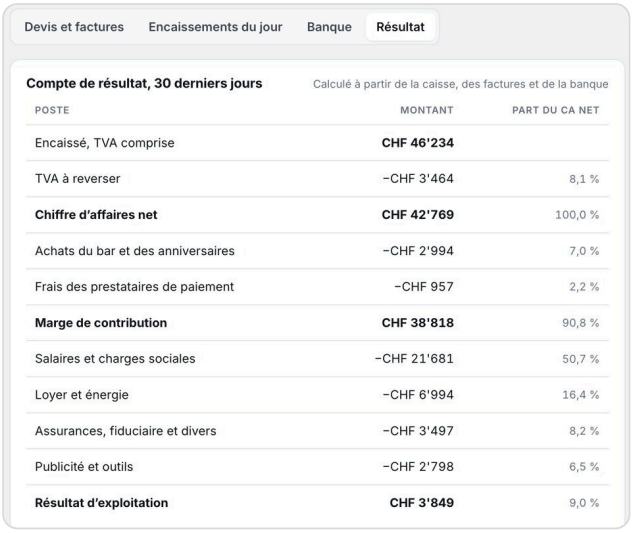
- Bookings went through an external tool, with no link to the till.
- Card terminals and online payments were not linked to bookings.
- Cash withdrawals were written down by hand, and the monthly statement was redone for the accountant.
- Advertising was paid for without knowing what it really brought in.

The goal

Bring booking, the till, the bank, the team and advertising together in one tool, for every site. The team had to be able to take payments and organise itself from their phones, and the accountant to receive a ready file every month.

What we built

- **Online booking** that customers can change and cancel themselves, with reminders 3 days before and the day before.
- **Till** on computer, tablet and phone: card on the terminal, TWINT by QR code, cash with change, item scanning.
- **Matched payments**: every night, card payments are linked to their booking when the match is certain, fees included.
- **Automatic profit and loss**, fed by the till, payment fees and imported bank statements, and a monthly file ready for the accountant, with access reserved for them.
- **Availability and time clocking** from the team app.
- **Google and Meta advertising** compared with the money actually received.
- **Temperature and humidity sensors** in every room, compared with the outdoor weather.
- **iOS and Android apps** for the team, with an iPhone notification for every online booking.



Profit and loss for the last 30 days, calculated from the till, invoices and the bank. Demo screen (in French), invented data.

The system in figures

20
management screens, adapted to each role

11
automatic tasks, run every hour or every day

7
payment methods brought together in one tool

10
different automatic emails

2
mobile apps for the team

5 min
between two readings of each sensor

And in your company

For you, it will be quotes, appointments, orders or registrations. The question stays the same: what does your team still type in by hand, and how many times? We come and see on site, then tell you in writing what can be automated.
